## Abstracts

Network forensics is a process of investigating and analyzing information about a network or network events. The network forensics is a specialized category within the more general field of digital forensics, and the technology is applicable in the various forms of IT data investigations. Typically, network forensics is a process of network analysis that tracks security attacks and other types of criminal activities on a network. The number of instances pertaining to data breaches is growing by the day. The number of breaches in data is not just in terms of numbers alone; however, the complexity involved in the attack mechanisms has also grown substantially. Almost every country has reported instances of data breach year on year. The regulations are formulated to protect the sensitive information which is vulnerable to attacks that can lead to identity theft and collateral damage or fraud. The obligations to abide by the increasingly complex laws have become a single most driving factor for a rapid adoption of data encryption solutions.

Based on the type, the Network Forensics market is segmented into Solution and Services. The Solution market is segmented into Intrusion Detection System (IDS)/Intrusion Prevention System (IPS), Security Information & Event Management, Threat Intelligence, Analytics Firewall, and Others. The Services market is further segmented into Professional and Managed Services. Based on Application Area, the market is segmented into Network Security, Application Security, Endpoint Security, Data Center Security, and Others.
