Pneumonia is a disease that causes lung contamination occurring in one or both the lungs caused by bacterial organisms, viruses, or fungi; bacterial pneumonia is the most common in adults. Pneumonia results in irritation around the ‘sacs’, also known as alveoli of the lungs, which causes the alveoli to fill with pus, resulting in breathing issues. PCV13 protects against the 13 kinds of pneumococcal bacteria which cause the most severe illness among children and adults. It is suggested for routine use among children that are 5 years or younger and adults 65 years of age and older. It is also suggested to help prevent pneumococcal disease in individuals through 64 years of age with medical conditions that place them at increased risk for pneumococcal disease. Development of protein-based combination pneumococcal vaccines is expected to offer lucrative opportunities for the expansion of this market during the forecast period.
