Starch is an example of natural polymer made by plants in plenty and corn starch is one of its types. Seemingly, corn starch is a derivative form of maize and it is a common constituent of food that is often used to thicken soups or in making corn sugars & corn soups. Food producers decrease the cost of production by adding a variable quantity of corn starch in food. This process is likely to boost the market over the foreseeable period. The rising shifting trend of petroleum with ethanol is likely to be the main driving factor over the coming years. Corn starch is the main raw material for the production of ethanol. Replacement risk from arrowroot in the food industry is supposed to impose a substantial threat to the market over the foreseeable period. Development in the field of biotechnology, amplified production of value-added chemicals as well as the discovery of novel fermentation organisms is likely to create abundant opportunities for the market players.
