Abstracts

The North America Liver Disease Diagnostics Market would witness market growth of 5.8% CAGR during the forecast period (2020-2026).

Liver transplantation is the second most common organ transplant in the world after liver transplant. However, less than 10% of the global demands for organ transplantation are being met at the current rate of transplantation. While these numbers are sobering, they provide a significant incentive to improve public health, considering that most causes of liver disease are preventable.

The contrast agent, gadoxetic acid, is administered into a peripheral vein. It is absorbed by the liver cells (hepatocytes) and removed by the bile ducts. Chronic inflammation of the liver tissue, such as viral hepatitis or fatty liver disease, may lead to scarring (fibrosis/cirrhosis) of the organ, leading to a reduction in the number of functioning hepatocytes and/or a decrease in the number of cellular transporters responsible for the absorption of the contrast agent into hepatocytes. It ultimately leads to a decreased reduction of the liver as a contrast agent. Radiation-free fMRI shows damage to the liver cell as decreased liver light and impaired excretion of the contrast agent in the bile ducts by serial imaging.

North America dominated the market in the regional market. High investment in R&D and the involvement of key players are expected to be responsible for the growth of the liver disease diagnostics market in the region. In addition, the existence of organizations offering information on the treatment of diseases to patients is expected to drive the

growth of the liver disease diagnostics industry. One such agency is GetPalliativeCare.org, which provides information on palliative care related to medical procedures such as endoscopy, CT scan, and biopsy.
