Abstracts

The North America Medical Imaging Workstations Market would witness market growth of 6.4% CAGR during the forecast period (2019-2025).

Workstations have gone far beyond what a software application used at a single location can do. Using scripts in a centralized archive, by exploiting investment in computer networks, we are now able to access established best practices for a specific kind of procedure. The technological infrastructure to capture and distribute workflows is currently under development. In the future, there will be the infrastructure needed to access a worldwide workflow archive, so participants will be able to reuse the best available experiences at other centers.

The image-guided workstation delivering high-intensity ultrasound-focused surgery is now being introduced across various centers. This is an example where a workstation is used within a magnetic resonance scanner while the patient lies inside. A targeted ultrasound array transducer is placed outside of the patient. This array can provide intense ultrasound within the body at a concentrated spot. The intense waves of ultrasound meet at one point and at this point they ablate the tissue without an incision.

The changing lifestyle and growing cases of the aging population are increasing the demand for new technology and solutions that can help to detect diseases efficiently and early. The government's emphasis on population management is also a major contributing factor to such infrastructure investment. Investments in research and development have seen the demand for new innovative technologies increase exponentially. Medical imaging is one such area that has witnessed such development.

Based on Usage Mode, the market is segmented into Thin Client Workstations and Thick Client Workstations. Based on Modality, the market is segmented into Computed Tomography (CT), Magnetic Resonance Imaging (MRI), Mammography and Ultrasound.
