Abstracts

The North America Teleradiology Market would witness market growth of 16.46% CAGR during the forecast period (2019-2025).

Teleradiology improves customer service by assisting radiologists in providing their expertise without actually being at the same location as the patient. This is important when radiologist subspecialists (e.g. MRI radiologists, pediatric radiologists, neuro-radiologists) are required because they are few and usually located in metropolitan cities. Therefore, teleradiology increases the reliability of radiology coverage by taking the images of a patient to the most advanced radiologist in a small town who is ideally qualified to interpret the specific radiologic test.

On the contrary, low scale healthcare facilities could use only one radiologist or none at all in rural areas. In such cases, being available throughout the day is virtually impossible for the radiologist. Having the support of a reporting system for teleradiology can both improve the quality of life of the individual radiologist and improve the quality of treatment that radiologist overwork can potentially reduce.

Teleradiology operates in three steps, the first step is to record and send images (scans) via an imaging center. The second step is to transmit images correctly and smoothly, and the last step is to receive and decode the image at the end of the receiver. There are several advantages of teleradiology implying including cost efficiency, convenience, 24*7 availability, faster delivery, etc. But there are also some drawbacks, like the heavy reliance on internet connectivity, questions about privacy, miscommunication, etc.

Based on product the market is segmented into X-Ray, Magnetic Resonance Imaging (MRI), Computed Tomography (CT), Ultrasound and Nuclear Imaging. Based on countries, the market is segmented into U.S., Mexico, Canada, and Rest of North America.
