## **Abstracts**

The North America Thermal Scanners Market would witness market growth of 9% CAGR during the forecast period (2019-2025).

A thermal scanner is a detection device which detects non-contact infrared (heat) energy and transforms it into electrical signals. It then generates thermal images and display temperature values and can measure temperature values. The thermal scanner's task includes inflammation inducement, prompting of peripheral nerve disease, early tumor warning, testing of other extreme diseases, and efficacy monitoring.

The infrared camera is used to detect high fever for quick body temperature measurement. Not just a person, but a large number of people can be scanned. This is why it is a valuable resource for researching densely populated areas such as transportation hubs, shopping centers and factories. The thermal scanners can tell who runs a high fever or has an elevated body temperature. However, this doesn't mean that the individual has coronavirus infection. Further detection and screening systems are required.

Traditional methods for inspecting large concrete structures like dams and cooling towers require building large amounts of scaffolding to allow access to the surface of the concrete structure. It helps to sound the concrete with an impact device or hammer to expose defective or damaged areas. Another method that helps to access the surface of a large concrete structure is the use of climbing inspections, which pose a considerable safety risk.

These traditional methods are used within a few inches of the surface to determine a defect or damage. Besides the logistic difficulty of these methods, a hammer might cause damage if proper care is not taken. Additionally, it can only cover a small area. Using a thermal imaging camera, thermal scanners use the infrared spectrum to show differences in heat dissipation from a structure. Health monitoring and detection of damage from large structures like bridges and high-rise buildings has been a very active area of research. Thermal scanners remain yet another promising technology for cost-effective health monitoring of structures.
