Abstracts

The North America Vibration Control System Market would witness market growth of 8.2% CAGR during the forecast period (2020-2026).

The alternative to or the speeding down of bulking machines is to use adaptive motion control that is software based. This software functions in two ways: vibration avoiding and damping. Technology which avoids vibration essentially filters vibrations caused by very dynamic movements. Damping technology, on the other hand, utilizes external feedback to mitigate kinetic energy to control vibration.

Vibration control can increase quality and yield when handling delicate or sensitive components, such as semiconductor wafers. Vibration control systems are drive-based adaptive motion control solution that manages both open-loop and closed-loop oscillation control in real time, harnessing the smarts on motion logic controllers and IndraDrive servo drives. The outcome is vibration damping that is easy to introduce and prevents major productivity reductions.

Filtering vibration avoidance happens with open-loop control — without external input. The controller models resonance-frequency mode on the device. The motion controller then sends location commands to cancel vibration and make corrections, going beyond techniques that simply apply an S-curve or jerk limiting the motion profile. In reality, vibration-avoidance functions are especially suitable for single-cell systems which have an object locked into a device with no change in load.

Based on Type, the market is segmented into Motion Control and Vibration Control.

Motion Control is further segmented into Springs, Hangers, Washers & Bushes and Others. Vibration Control are further bifurcated across Isolating Pads and Isolators & Others. Based on End User, the market is segmented into Manufacturing, Automotive, Electrical & Electronics, Aerospace & Defense, Oil & Gas and Others. Based on countries, the market is segmented into U.S., Mexico, Canada, and Rest of North America.
