The North America Web Application Firewall Market would witness market growth of 15.5% CAGR during the forecast period (2017 – 2023). A Web application firewall (WAF) monitors, filters and blocks data packets while data travels to and fro within a Web application. A WAF could be network-based, host-based or cloud-based. It is generally deployed through a proxy and placed in between a client and web application. Running as a network appliance, server plug-in or cloud service, the WAF keeps a check on each of the packets and incorporates rule base to analyze Layer 7 web application logic and filter out traffic that is potentially harmful. WAF is put to use for protecting web applications against some of the most commonly known attacks such as cross-site scripting and SQL injection. It keeps a watch on the content of each encrypted and unencrypted inbound web traffic and detects advanced levels of attack types.
