Abstracts

The global Cushing's Syndrome Diagnostic and Treatment market is expected to grow at a CAGR of 8.28% to reach a total market size of US\$404.546 million by 2023, increasing from US\$250.992 million in 2017. Cushing's disease is a condition characterized by the presence of excess steroid hormone 'cortisol' or stress hormone in blood vessels and is caused by improper functioning of pituitary glands which are responsible for secreting adrenocorticotrophic hormone (ACTH). ACTH stimulates the adrenal glands (located on top of the kidneys) to produce cortisol. Typical symptoms of the Cushing's syndrome are weight gain, an appearance of pink or purple stretch marks and thinning and easily bruised skin and occasionally type 2 diabetes. Treatment includes reducing the use of corticosteroids, surgery, and medications.

This research study examines the current market trends related to the demand, supply, and sales, in addition to the recent developments. Major drivers, restraints, and opportunities have been covered to provide an exhaustive picture of the market. The analysis presents in-depth information regarding the development, trends, and industry policies and regulations implemented in each of the geographical regions. Further, the overall regulatory framework of the market has been exhaustively covered to offer stakeholders a better understanding of the key factors affecting the overall market environment.

Identification of key industry players in the industry and their revenue contribution to the overall business or relevant segment aligned to the study have been covered as a part of competitive intelligence done through extensive secondary research. Various studies and data published by industry associations, analyst reports, investor presentations, press releases and journals among others have been taken into consideration while conducting the secondary research. Both bottom-up and top-down approaches have

been utilized to determine the market size of the overall market and key segments.
