## Abstracts

The global hypodermic needle market is evaluated at US\$ 2,489.851 million for the year 2018. A hypodermic needle is a hollow needle commonly used with a syringe to inject substances into the body or extract fluids from it. Hypodermic needle provides rapid delivery of the liquids and is used to deliver drugs that cannot be ingested or absorbed orally. These needles are therefore used for different applications such as drug delivery, vaccination, and blood specimen collection. The market is expected to show significant growth during the forecast period. The growth may be attributed to the rising prevalence of chronic diseases such as diabetes and cancer across the globe. Technological advancements in hypodermic needle-based drug delivery will also boost the market for hypodermic needle. However, availability of the alternative modes of drug delivery might restrict the growth of the market. The growth of the market may also be hampered by the lack of awareness regarding the use of hypodermic needles in the emerging economies during the given time frame.
