## Abstracts

The global syringes market is expected to grow at a CAGR of 7.88% over the forecast period of 2017-2023. Syringes are the medical devices used to inject or withdraw fluid from the body. It consists of a hollow cylinder, a plunger and a needle attached to the cylinder. The downward movement of the plunger results in injecting the fluid into the body, whereas upward movement of the plunger results in withdrawal of the fluid from the body. The syringes were once made from glass and metal and needed to be sterilized before use which have now been replaced by syringes made of plastic and are already pre-sterilized. The rise in the market may be attributed to the rising patient population base requiring injecting drugs or withdrawal of fluids for the diagnostic purpose from the body. Further, rising awareness regarding various vaccinations along with various advancements such as introduction of smart syringes have led to the boost in the market during the given forecast period. However growing focus on the alternative drug delivery methods such as patches and oral might hamper the market during the given time frame.
