## Abstracts

Graphene Battery Market is projected to grow to US\$70.464 million by 2023 from US\$28.866 million in 2017, at a CAGR of 16.04%. Graphene is an allotrope of carbon and is the strongest, lightest and the most powerful conductor of electrical and thermal energy. It provides high power to electric cars, drones and other electric devices than any other existing technology. Graphene is widely used in supercapacitors and battery construction. Graphene batteries are lightweight chemically inert, durable, better suited for high capacity energy storage, have a longer lifespan and get electrically charged in short intervals as compared to other batteries. Growth in global graphene market is driven by accelerating global sales in electric cars and other electronic devices. Heavy utilization of these batteries in many industrial applications coupled with the rising awareness of the need to switch to non-conventional sources of energy is also augmenting the demand for these batteries. However fabricating graphene in large quantities at an affordable price, and absence of knowledge about its technological potential is hampering the market growth. North America and APAC region will drive the global market of graphene batteries over the forecasted period.
