## Abstracts

The non-powdered surgical glove market was valued at US\$1,843.245 million in 2018 and is anticipated to grow at a CAGR of 8.58% during the period 2018-2024. Non-Powdered or powder-free surgical gloves are disposable gloves that do not have their inner layer powdered making them harder to put on. Also, they prevent any risk of infections to either the patient or the caregiver. The demand for non-powdered gloves is poised to grow at a good rate due to the recent bans on the use of powdered gloves, due to the cases of infections and medical problems caused by the cornstarch used in them. In 2017, the FDA has implemented a ban on powdered gloves. This coupled with the rising adoption towards synthetic gloves, that are latex-free and non-powdered, is further going to boost the market growth in the upcoming years. However, irritation in use and higher chances of rips and tears of non-powdered gloves is expected to restrict the market to grow to its full potential. The North American and European regions hold a substantial share in the market due to high investment and development in the healthcare industry.
