## Abstracts

The pain management devices market is projected to grow at a CAGR of 10.58% to reach US\$8.840 billion by 2024, from US\$4.834 billion in 2018. Pain may be defined as the unpleasant sensory experience caused due to damage to the tissue or illness. Pain management is the branch of medical sciences dealing with the prevention, diagnosis, and treatment of acute chronic pain. It plays an important role in identifying the precise source of the problem and isolating the optimal treatment. The pain management is generally guided by history of the pain, its intensity, duration, aggravating and relieving conditions, and structures involved in causing the pain. The growth in the market may be attributed to the large and rising patient population base. Adverse effects associated with the pain medication and growing demand for long term pain management will also bolster the market growth through to 2024. However, low awareness regarding the use and availability of the pain management devices and availability of low-cost pain medications might restrain the market for pain management devices during the given time frame.
