Abstracts

The global peripheral vascular devices market is projected to grow at a CAGR of 4.62% to reach US\$6.234 billion by 2024, from US\$4.753 billion in 2018. Peripheral vascular devices are used to diagnose and treat peripheral vascular diseases. Peripheral vascular disease (PVD) refers to blood circulation disorder that causes the blood vessels outside the heart and brain to narrow, block, or contract. In PVD, blood vessels become narrowed and blood flow decreases affecting the blood and oxygen supply to major organ such as arms, legs, stomach, kidneys and intestines. As the disease progress, clots may develop completely blocking the artery resulting in organ damage. The peripheral vascular devices market is expected to show robust growth during the forecast period owing to the rising incidences of Peripheral Arterial Disease (PAD). Rising preference of minimally invasive procedures using peripheral vascular devices is also expected to boost the market for the peripheral vascular devices. However, stringent regulatory policies leading to the delay in market approval of these devices and availability of alternate first line treatments might hamper the market for peripheral vascular devices during the given time frame.
