## Abstracts

The global transdermal drug delivery system market is estimated to register a CAGR of 8.91% over the forecast period of 2017-2023. Transdermal drug delivery involves delivering the drug the medications in systemic circulation through skin at a controlled rate, thereby, maintaining effective plasma level concentration of the drug in body over prolong period of time. The drugs are usually applied in the form of ointment, patches or plaster which is then absorbed into the systemic circulation. Skin age, condition, physicochemical factors and environmental factors are some factors that are to be considered while delivering drug through this route. The drug delivery is non-invasive and bypass first pass metabolism, thus, increasing the bioavailability of the drug. The rise in the market is attributed to the rising adoption of the TDDS due to the various advantages offered by TDDS such as prolonged therapeutic effect, reduced side-effects, improved bioavailability, better patient compliance and easy termination of drug therapy. However, inability of the skin to absorb large range of medications will restrain the market during the forecast period.
