The scale and scope of microbiome research activity has now become one of the fastest growing areas in biology. The relevance that it has shown for the welfare of the society and pharmaceutical industry has led to the development of a transdisciplinary

environment that is however conducive to innovation with a mission to abolish the limitations in the pharmaceutical industry through excellence in microbiome research, awareness and outreach. Over the years now, gut microbiome is estimated to implicate success for the various immunotherapies.

Microbiome's role in immunology practices is to transform the world-class treatment into the medicine of today and tomorrow. It is highly recognizable that the healthcare issues that mankind is facing today is now bigger than any one solution. The treatment of certain diseases requires multiple options for the treatment and ultimately prevention. Therefore, the amalgamation of two different treatment paradigms i.e. microbiome and immunology are apparently delivering some medical benefits that millions of patients were in need for long period of time. The ways in which microbiome is understood and manipulated to serve the immunological aspects has given great interest to all the researchers.

Essential and usual concept of immunology depicts targeting the immune system of the body to provoke an immune response with huge impact but then unsuccessful implication of immunology therapies driven treatments led to exploration of several other basic concepts that could play an important role in boosting the immune system when combined. Looking forward, the microbiome community in the gut represented beneficial patterns with respect to further research. The area of microbiome research and its combination with immunological aspect for the disease treatment has produced a real excitement in the area of medical research and specifically microbiome research.

All over the world, the amalgamation of the two has been well accepted and appreciated by the patients, physicians and the clinicians. Investigation of all the working sides of microbiome and how it plays an important role in boosting the manipulated immune cells have recently started in large numbers as the technology available in the medical field allows to capture it accurately. To facilitate the microbiome and immunology community in order to extract the best and trending opportunities that are stemmed into the microbiome research, the experts from both the relevant disciplines are analyzing it through clinical researches and surveys. Further, the area is getting supported by 86 different clinical trials getting conducted in different countries.

'Global Human Microbiome Immunology Therapeutics Market & Clinical Trial Insight 2025' report summarizes the view of the wider opportunities that are associated microbiome community for the advancement of the scientific information regarding immunology. The science that is related with microbiome has high interdisciplinary and various opportunities that somehow have remained hidden in the medical world. It is

believed that the opportunities and all the desirable tangible benefits microbiome is capable of delivering when combined with immunology is large and needs coordinated and constructive approach. The call to the two different sectors i.e. microbiology and immunology is estimated to unlock the potential and promising benefits of microbiome. The approach leading to the extraction of advantages if properly embedded in the microbiome and immunology research, the future benefits will be huge
