A heat shield is designed to shield a substance from absorbing excessive heat from an outside source by either dissipating, reflecting or simply absorbing the heat. It is often used as a form of exhaust heat management.

Due to the large amounts of heat given off by internal combustion engines, heat shields are used on most engines to protect components and bodywork from heat damage. As well as protection, effective heat shields can give a performance benefit by reducing the under-bonnet temperatures, therefore reducing the intake temperature. Heat shields vary widely in price, but most are easy to fit, usually by stainless steel clips or high temperature tape.

The average price of the automotive heat shield is showing downstream trend, the gross margin is about 21% in 2016; it has the similar trend with price;

In the future, the total install ratio will still have increase trend, and the total consumption volume will have great influence by the automotive industries' development.

Over the next five years, LPI(LP Information) projects that Automotive Heat Shield will register a 6.7% CAGR in terms of revenue, reach US\$ 16500 million by 2023, from US\$ 11200 million in 2017.
