The report requires updating with new data and is sent in 48 hours after order is placed.

Desulfurization and Denitrification is after floating ash in flue gas is roughly removed in the dry type electrostatic precipitator, the gas flows through the GGH extractor to be cooled to approximately 110 deg. C. In the spray cooler, the gas is further cooled to 60 - 70 deg. C, the desirable temperature level for desulfurization reaction, the necessary amount of ammonia for desulfurization and denitrification is added. The gas then moves into the process vessel, where E-beam is applied to it. In the process vessel, SO<sub>x</sub> and NO<sub>x</sub> are oxidized to become sulfuric acid and nitric acid, respectively, which in turn react with ammonia to produce fine particles of ammonium sulfate and ammonium nitrate, respectively.

The industry development of Desulfurization and Denitrification was largely affected by national industrial policies and environmental standards in recent few years. With stricter emission standards worldwide and backward emission technology, China consumption of Desulfurization and Denitrification decreased to 20270.03 M RMB in 2015.

Over the next five years, LPI(LP Information) projects that Desulfurization and Denitrification will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
