In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global 2D Gesture Recognition market for 2018-2023.

Gesture recognition is a mathematical calculation of interactions performed by a human being via a computing device. The interactions performed are passed through a number of mathematical algorithms before the computing device interprets it. Gesture recognition involves:

Gesture recognition enhances efficiency and ease of usage for the underlying logical design of a stored program. Gesture recognition avoids the usage of keyboards and mouse for any action. It can be classified as 2D and 3D gesture recognition technologies. 2D gesture recognition makes use of a camera-enabled device.

In gesture recognition, an invisible infrared light is beamed on the individual standing in front of the camera. This light is then reflected back to the camera, from where it is sent to a gesture recognition IC. The IC, with the aid of gesture recognition software, then creates a depth map of the images received and responds appropriately to the movements in front of the camera. 2D gesture recognition offers a user-friendly environment between a device and an individual. It is a cost-effective gesture recognition technique for interaction.

Over the next five years, LPI(LP Information) projects that 2D Gesture Recognition will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
