The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Astronomical Telescope market for 2018-2023.

Astronomical telescope is an optical instrument used to view heavenly bodies such as moon, stars, planets and distant objects. An astronomical telescope consists of two convex lenses: objective and eye piece. The objective is a convex lens of large focal length and large aperture. It is usually made of two convex lenses in contact with each other to reduce the chromatic and spherical aberrations. The eye piece is also a convex lens. Its focal length is smaller than that of the objective. It is also a combination of two lenses.

Currently, the market of astronomical telescope is getting more and more concentrated. The global largest producer of astronomical telescope Synta, which holds three top brands of astronomical telescope (Celestron, Meade and Sky Watcher) and OEM for other brands, is announced to account for about 60% of the global total market. As to the product types and applications of astronomical telescope, refracting telescope and reflector telescope are main types and entry-level telescope accounts for about 90% of the total market.

Over the next five years, LPI (LP Information) projects that the Astronomical Telescope market will register a 8.6% CAGR in terms of revenue, reach US\$ 290 million by 2023, from US\$ 180 million in 2017.
