## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Automated Parking Systems market for 2018-2023.

An automated (car) parking system (APS) is a mechanical system designed to minimize the area and/or volume required for parking cars. Like a multi-story parking garage, an APS provides parking for cars on multiple levels stacked vertically to maximize the number of parking spaces while minimizing land usage. The APS, however, utilizes a mechanical system to transport cars to and from parking spaces (rather than the driver) in order to eliminate much of the space wasted in a multi-story parking garage. While a multi-story parking garage is similar to multiple parking lots stacked vertically, an APS is more similar to an automated storage and retrieval system for cars.

Automated parking is the process of storing and retrieving various size vehicles by utilizing the latest automation technology to eliminate the need for parking ramps, driveways and human intervention which provides much greater parking density compared with conventional parking. Automated parking system is most used in the residential, mall, office building and other area

With increased focus on solving the parking space problem; the automated parking system market is likely to witness a Steady growth in coming years.

Over the next five years, LPI(LP Information) projects that Automated Parking Systems will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
