## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Automated Sortation System market for 2018-2023.

Automatic sorting machine is the machinery that according to the preset computer instruction to sorting of goods and delivering the goods to the specified location. Automated Sortation System is similar to conveyors but typically having higher capacity and can divert containers more quickly. Typically used to distribute high volumes of small cartons to a large set of locations, automated sortation systems offer a highly accurate and efficient means of sorting, routing, consolidating, and diverting a wide range of parcel types to unique destinations for the purposes of order selection, processing, packaging, palletizing, storing, and shipping.

In such systems, groups of orders are delivered to a recirculating conveyor system where they are sorted into shipping lanes for final preparation and loaded onto waiting trucks. Developing a model of the sorting process, which incorporates the stochastic elements of these systems, to determine the relative merits of two common categories of sorting strategies found in industry: fixed priority schemes and the next available rule. Fixed priority schemes include such popular rules as 'sort the largest (or smallest) orders first'. In systems with little lane blocking, a rule which assigns the next available order to a shipping lane will outperform any fixed priority scheme in terms of sorting time and system throughput while in systems with significant lane blocking, the sorting rule has little impact.

Over the next five years, LPI(LP Information) projects that Automated Sortation System will register a 6.2% CAGR in terms of revenue, reach US\$ 6520 million by 2023, from

US\$ 4540 million in 2017.
