Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Automobile Heat Exchangers market for 2018-2023.

An automobile heat exchanger is a device designed for the purpose of allowing heat transfer from one medium to another at different temperatures. Most commonly, these mediums consist of two fluids that flow close to each other and are separated by a material, often metals, with good heat transfer properties. The fluids are primarily characterized by their temperatures at the entrance to the heat exchanger. The hot (warm, in figure below) fluid, the fluid with the highest temperature initially, transfers heat to the cold fluid as they both pass through the heat exchanger, thus lowering the temperature of the hot fluid and raising the temperature of the cold fluid.

According to the report, one of the major drivers for this market is heavy dependence on IC engines for mobility in emerging countries. Emerging countries like India and China are witnessing an increase in the preference for mobility through roadways. In 2016, IC engines held a market share of more than 95% of the total vehicles sold globally. In the commercial vehicle segment, there is hardly any vehicle that runs on battery or on alternate fuels. Hence, there is high reliance on IC engines for transportation.

Over the next five years, LPI(LP Information) projects that Automobile Heat Exchangers will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
