Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Autonomous Vehicles & ADAS market for 2018-2023.

Advanced driver-assistance systems, or ADAS, are systems to help the driver in the driving process. Autonomous driving is supported by cloud data, car-to-car communication, and car-to-infrastructure communication. In consequence, ADAS systems must link to a vehicle's communication module directly to enable fully autonomous driving

The race to develop autonomous vehicles (AV) and advanced driver assistance systems (ADAS) is on. Major vehicle original equipment manufacturers and tier-1 suppliers, as well as disruptive newcomers, are accelerating AV and ADAS development efforts to get ahead in the race.

Autonomous driving technology — involving radar, lidar, V2X communication, sensor fusion and deep learning — is drastically different from traditional automotive technology. Moreover, it is safety critical, so any errors could quickly lead to fatal consequences. Companies would ideally need to road test autonomous vehicles for billions of miles to meet safety standards, but that would require centuries of development time. AV and ADAS development can only be achieved with the speed, economy and precision of computer simulation. Simulation is centrally important in developing autonomous vehicles. Using simulation, engineers can rapidly test thousands of driving scenarios. They can also optimize the performance of sensors and algorithms, accelerating time to market.

Over the next five years, LPI(LP Information) projects that Autonomous Vehicles &

ADAS will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
