In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Battery-powered Breast Pumps market for 2018-2023.

A breast pump is a mechanical device that lactating women use to extract milk from their breasts. They may be manual devices powered by hand or foot movements or electrical devices powered by batteries or electricity from the grid.

Rising adoption of online retail?increasing disposable income?growing awareness about breastfeeding?rate of employment among women and rising birth rates are main factors leading to the growth of market. Breastfeeding is one of the most critical and vital aspects of care. It is recommended that infants be breastfed for at least six months from birth. As per the lactation specialists, the mother's milk is one of the most vital sources of antibodies, antioxidants, proteins, and a complete nutritional mix, which helps the baby to get a healthy and disease-free life. Increasing rate of working women is expected to serve this industry as a high impact-rendering driver. Working mothers hold relatively higher disposable incomes and lesser time to breastfeed their babies. As a result, they are regarded as ideal customers of breast pumps. The market for battery-powered breast pumps is experiencing growth in the Americas due to the presence of major market players in the region. APAC dominated the market on account of the population expansion.

Over the next five years, LPI(LP Information) projects that Battery-powered Breast Pumps will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
