The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Biochar market for 2018-2023.

This report studies the Biochar market, Biochar is the solid product of pyrolysis, designed to be used for environmental management. IBI defines biochar as: A solid material obtained from thermochemical conversion of biomass in an oxygen-limited environment.

Biochar is charcoal used as a soil amendment. Like most charcoal, biochar is made from biomass via pyrolysis. Biochar can increase soil fertility of acidic soils (low pH soils), increase agricultural productivity, and provide protection against some foliar and soil-borne diseases. Furthermore, biochar reduces pressure on forests. Biochar is a stable solid, rich in carbon, and can endure in soil for thousands of years.

Biochar is a fragmented industry with a variety of manufacturers, among which most are small privately-owned companies. The top 5 producers account for just 38.34% of the market. Also, many companies are emerging companies that specialized in the production of biochar, and a large share of their products is sold by traders and online. A key variable in the performance of biochar producers is raw material costs, specifically the speed at which any increase can be passed through to customers. The materials of biochar include wood, rice stove, corn stove and other biomass materials. Wood now is the major raw material of biochar, but its price would be higher than other derived product. The price of crop raw material fluctuates with agricultural market in local market.

Over the next five years, LPI(LP Information) projects that Biochar will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
