Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Biometric Access Control Systems market for 2018-2023.

Biometric technology uses human physical attributes as locks and keys, making it particularly suitable for access control systems on the buildings of large organisations. Using biometrics for security and identification requires meeting two challenges: they must be cheap enough and sufficiently simple to be used by ordinary users. Furthermore, for enhanced security, these biometric access control systems should combine two or more types of authentication, such as coupling fingerprints with key codes or passwords to provide greater trust that who is logging in is only who is expected to do so.

The shift from non-biometrics technologies such as PINs and smart cards for controlling access to secure premises drives the growth of the biometric access control systems market. Some biometric technologies such as fingerprint and iris recognition are being used for the same. Since these biometric technologies are cost-effective and user-friendly, integration of access control systems with these biometric technologies is expected to provide significant traction to the market during the forecast period.

Currently, the North America and Europe regions are experiencing higher adoption of biometric access control systems across BFSI and government sectors. APAC, Latin America, and MEA are also expected to increase their adoption during the forecast period. The transportation and healthcare sectors are likely to emerge as one of the biggest adopters of biometric systems during the same period.

Over the next five years, LPI(LP Information) projects that Biometric Access Control

Systems will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
