In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Biopreservation market for 2018-2023.

The process of applying natural or controlled antimicrobials to preserve food materials for extending its shelf life is known as biopreservation. The biopreservation process is usually carried out with the help of lactic acid bacteria (LAB) as they are inhibitory to microbes responsible for food spoilage.

There are main factors contributing to the growth of market including to Improving Healthcare Expenditure, Increasing Advancements in Research and Development, Adoption of In-House Sample Storage in Hospitals and Labs and Investments in Biobanks and Personalized Medicine. Healthcare spending continues to rise faster than the economic growth in most countries, maintaining a trend that has been observed over decades. The presence of equitable, responsive, and efficient health systems across North America, Europe, UK, and Asia-Pacific, has also contributed to the maximum share of GDP that is being utilized in healthcare expenditure. Biopreservation facilities require highly sophisticated equipment and instruments to maintain samples at constant temperatures. These sophisticated equipment and instruments are expensive, and their high cost is a major restraint for the growth of the global biopreservation market. North America has the largest share of this market in 2015, while Asia is expected to grow at the fastest rate during the forecast period. Growth in the Asian biopreservation media & equipment market will primarily be driven by the increasing healthcare spending and growing population in this region.

Over the next five years, LPI(LP Information) projects that Biopreservation will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in

2017.
