Bovine respiratory disease (BRD) is a multifactorial and complex disorder caused due to combination of more than one microbial pathogens, impaired host immunity, inadequate housing conditions, and environmental factors. The major factor leading to bovine respiratory diseases are host factors, environmental factors, and direct influence of infectious agents such as virus, bacteria, and parasites. However, due to increasing consumption of milk and beef products, the need for bovine respiratory disease treatment has increased across the globe.

One of the major factors responsible for the market's growth is the increasing interests of several vendors on the development of novel drugs to gain a competitive advantage over their competitors. For instance, Bayer HealthCare launched Zelnate in the US, which is a bacterial-produced plasmid DNA including a liposome carrier that helps to stimulate the innate immune system in cattle. Furthermore, under traditional antibiotics segment also, vendors are launching various drugs such as draxxin for the cattle respiratory disease treatment. The growing focus on the development of combination drugs will drive the growth prospects for the global BRD treatment market for the next few years. Some of the major factors responsible for the growing number of development of combination drugs is the need to offer improved efficacy and ensure better treatment outcomes.

North America accounts for a major share in the global market, of which around 90% is held by the U.S. alone. The bovine respiratory disease treatment market in the U.S. is
