## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Breast Biopsy market for 2018-2023.

A breast biopsy is the procedure of locating a diseased tissue in the breast and collecting the specimen sample of the area for further examination and diagnosis. Breast biopsies are performed by using minimally invasive biopsy systems, owing to minimal disfigurement and pain. Non-invasive biopsy techniques provide preventive measures that assist physicians in diagnosing and treating high-risk breast cancer. This information prevents the application of chemotherapy in breast cancer, reducing the complexities of chemo-radiations. Vacuum assisted breast biopsy devices (VAB), core needle biopsies and fine needle aspiration biopsy are commonly used to perform biopsy procedures.

Approximately 12% women in the U.S. are likely to develop breast cancer during their lifetime. Factors contributing to rise in breast cancer cases is over consumption of alcoholic drinks, lack of physical exercise, improper diet and eating habits, high level of hormonal imbalance & exposure of skin to intense sunlight. However, limited awareness among female population and substandard healthcare facilities especially in developing regions are the factor restraining the growth of breast biopsy market.

North America is expected to account for the largest share of the breast biopsy market, followed by Europe. However, Asia-Pacific is expected to register a higher growth rate during the forecast period. The growth of the breast biopsy market in Asia-Pacific will be centered on China and India.

Over the next five years, LPI(LP Information) projects that Breast Biopsy will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in

2017.
