## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Breather Membrane market for 2018-2023. A breather membrane is a thin sheet of fabric that sits above insulation and rafters, but underneath the roof slates. The construction of the fabric allows any condensation to rise up into the roof void but prevents the condensing water from dripping back down into your roof. Instead, it channels the water down into the gutter, preventing many problems.

Breathable membranes for walls tend to be of a generally lower specification than those used within roofs due to the nature of the application. Normally a roof breather would also be suitable as a high specification wall breather, but a wall breather would almost certainly not be suitable for use in a roof.

Over the next five years, LPI(LP Information) projects that Breather Membrane will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
