The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Capecitabine market for 2018-2023.

Capecitabine is an orally-administered chemotherapeutic agent used in the treatment of metastatic breast and colorectal cancers. Capecitabine is a prodrug, which is enzymatically converted to fluorouracil (antimetabolite) in the tumor, where it inhibits DNA synthesis and slows growth of tumor tissue.

Capecitabine is a prescription medication used to treat breast cancer and cancer of the colon or rectum. Capecitabine belongs to a group of drugs called antimetabolites which work by interfering with DNA production, stopping cells from multiplying. The medication comes in tablet form and is usually taken twice daily, within 30 minutes after the end of a meal. The proportion of breast cancer with Capecitabine in 2016 is about 40%, and the proportion of colorectal cancer in 2016 is about 31.94%.

Cancer clinical treatment projects have led to the increasing demand for Capecitabine. Increasing Cancer incidence across the globe, especially in the Asia-Pacific is another major factor, driving the growth of the Capecitabine market during the forecast period. Over the next five years, LPI(LP Information) projects that Capecitabine will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
