Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Capsule Endoscopy market for 2018-2023.

Capsule Endoscopy uses a swallowed video capsule to take photographs of the inside of the esophagus, stomach, and small intestine. For capsule endoscopy, the intestines are first cleared of residual food and bacterial debris with the use of laxatives or purges very similar to the laxatives and purges used before colonoscopy.

The capsule contains one or two video chips (cameras), a light bulb, a battery, and a radio transmitter. As the capsule travels through the esophagus, stomach, and small intestine, it takes photographs rapidly. The photographs are transmitted by the radio transmitter to a small receiver that is worn on the waist of the patient who is undergoing the capsule endoscopy.

Middle East is the largest supplier of Capsule Endoscopy, with production market share over 60%, while the sales market share is only 6%. That is to say, there are a large number of exports in Middle East.

Asia, following Middle East, takes production market share of 22% and the sales market share over 28%. China is an important market of Capsule Endoscopy in Asia, accounting for 11% production market share and 12% sales market share of global market.

Over the next five years, LPI(LP Information) projects that Capsule Endoscopy will register a 9.2% CAGR in terms of revenue, reach US\$ 280 million by 2023, from US\$ 170 million in 2017.
