In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Cloud Security market for 2018-2023.

Cloud computing security or, more simply, cloud security refers to a broad set of policies, technologies, and controls deployed to protect data, applications, and the associated infrastructure of cloud computing. It is a sub-domain of computer security, network security, and, more broadly, information security.

Basically, cloud professional services market defines the services which are accessible by the consumers as per their demand through the internet. These services are generally delivered to the customers through a cloud computing vendor or a third party service provider. Thus compared to the legacy on premise systems, cloud based services and solutions save the infrastructure and operational costs involved at the customer's end as these services are completely managed by the cloud based service providers.

Cloud based professional services generally include consulting services such as training services, advisory services; system and network integration services such as application load and performance testing services and others; and deployment and support services includes data backup and recovery services, storage security services and others.

Over the next five years, LPI(LP Information) projects that Cloud Security will register a 25.5% CAGR in terms of revenue, reach US\$ 16000 million by 2023, from US\$ 4090 million in 2017.
