Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Cold Plasma market for 2018-2023.

Cold plasma or non-equilibrium plasma is a plasma which is not in thermodynamic equilibrium, because the electron temperature is much hotter than the temperature of heavy species (ions and neutrals). As only electrons are thermalized, their Maxwell-Boltzmann velocity distribution is very different than the ion velocity distribution.[1] When one of the velocities of a species does not follow a Maxwell-Boltzmann distribution, the plasma is said to be non-Maxwellian.

A kind of common nonthermal plasma is the mercury-vapor gas within a fluorescent lamp, where the "electron gas" reaches a temperature of 20,000 kelvins while the rest of the gas, ions and neutral atoms, stays barely above room temperature, so the bulb can even be touched with hands while operating.

The surface treatment segment accounted for the largest share of the market for the polymer and plastic industry. This market segment is majorly driven by the advantages of cold plasma surface treatment, such as increased durability, better hydrophobic properties, higher packing density, better film quality, enhanced coating surface smoothness, and lower cost.

Wound healing is the fastest growing application segment in the market for medical industry during the forecast period. The benefits of cold plasma technology in wound healing applications faster healing and better results, sterilization efficiency, & cost-effectiveness as compared to conventional methods are driving the growth of this application segment.

Over the next five years, LPI(LP Information) projects that Cold Plasma will register a 16.2% CAGR in terms of revenue, reach US\$ 41100 million by 2023, from US\$ 16700 million in 2017.
