In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Compression Fitting market for 2018-2023.

A compression fitting is a type of coupling used to connect two pipes or a pipe to a fixture or valve. A compression coupling works by using clamping force to seal the fitting. The unit commonly consists of a compression nut, a compression ring and a seat. The compression ring, often called a ferrule, is placed on the tubing with the nut behind it. The tubing is then inserted into the seat, and the nut is screwed onto the seat. As the nut is tightened, it compresses the ring around the tubing, creating a leak-free seal.

Over the next five years, LPI(LP Information) projects that Compression Fitting will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
