## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Compressor Valve market for 2018-2023.

Compressor valves are valves used within a compressor to allow gas flow to and from the cylinder area. They operate based on pressure difference: if the pressure below the valve is greater than the pressure above plus the spring force, it opens. The valves function as spring-loaded non-return valves, with the gas only being able to flow in one direction.

The compressor valve is mainly used to support the production and maintenance of the compressor. Therefore, it is mainly concentrated in Europe and North America. Among them, European consumption accounts for over 40% of the total.

The global market for compressor valve has been in mature status for the past years. The reciprocating compressor was one of the earliest compressors invented, and the valve, as the main part of the reciprocating compressor, was extremely easy to damage, and the screw compressor gradually became a mainstream.

In the downstream, Mechanical Field and Oil and Gas are the main consumer areas, accounting for more than 66% of consumption in both areas.

we tend to believe this industry now is close to mature, and the consumption increasing degree will show a smooth curve. On product prices, the slow downward trend in recent years will maintain in the future, as competition intensifies, prices gap between different brands will go narrowing. Similarly, there will be fluctuation in gross margin.

Over the next five years, LPI(LP Information) projects that Compressor Valve will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
