In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Demineralized Allografts market for 2018-2023.

Demineralized Allografts is tissue harvested from one individual and implanted into another of the same species. In a search for an adequate substitute for autogenous bone, cadaveric allograft has been a viable option. Structural and morselized forms are available and prepared as either fresh-frozen or freeze-dried. These grafts provide a structural framework or scaffold for host tissue to grow, hence making allograft osteoconductive. Conversely, its osteoinductive properties are mediocre at best. Upon implantation, the host is expected to experience an intricate immune response. Freezing or freeze-drying the allograft is crucial in minimizing this reaction; however, the fundamental properties of the material may be altered.

The classification of demineralized allografts includes gel, putty and putty with chips, and the proportion of putty in 2016 is about 46%, and the proportion is in decreasing trend from 2012 to 2016.

North America region is the largest supplier of demineralized allografts, with a production market share nearly 90% in 2016. Europe is the second largest supplier of demineralized allografts, enjoying production market share nearly 8% in 2016.
