In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Drum Pump market for 2018-2023.

Drum pump refers to pumps that are used to empty barrels, tanks, IBCs and drums. Many liquids used on manufacturing and processing plants are delivered in 100 or 200 litre barrels and are too heavy to tip to empty the liquids inside. Drum pumps consist of a vertical shaft inside a narrow tube which fits inside the drum opening. The pump motor is attached to the vertical shaft at the top of the tube outside and above the drum and the pumping element is located at the end of the shaft inside the drum. This configuration allows the drum to be emptied without tipping and so reduces the risk of spills and operator injury.

Although international economic situation is complicated, there will be many uncertainties in the next few years. Due to the government policy and the high production of drum pump in the international market, the current demand for drum pump product is relatively high in the mature market, such as North America and Europe.
