Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Electric Bus market for 2018-2023.

An electric bus is a bus powered by electricity. An electric bus uses electric motors or traction motors for propulsion. An electric bus may be powered through a collector system by electricity from off-bus sources, or may be self-contained with a battery or generator to convert fuel to electricity.

The electric bus includes battery electric bus and hybrid bus. The battery electric bus occupies most part of the production. The main production base is located in the China, so the China is the largest production region in the world.

Currently, most country has the policy support in the electric bus, like the tax support. The sales price is relative low after the subsidies, so the demand has a high growth rate.

The most important technology of the electric bus is in the battery. The battery's power density is relative low, and it can't meet the consumer's demand. And the company who gets the key technology of battery will get an advantage in the electric bus industry. The price is relative high than the price of the traditional bus, but due to the government's support, the price has a certain decrease.

In the future, the battery will play an important role in the development of the electric bus; the policy also plays an import role. In the future, if any company wants to enter into the new energy vehicle industry, the battery will be the most important feature. And China will be more and more important in the industry, due to the government give more support to the electric bus than electric passenger vehicles.

Over the next five years, LPI(LP Information) projects that Electric Bus will register a xx% CAGR in terms of revenue, reach US\$ 33600 million by 2023, from US\$ 33600 million in 2017.
