Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Electrophysiology (EP) Device market for 2018-2023.

Electrophysiology (EP) is the study of the mechanism, function and performance of electrical signaling pathways that guide the functioning of the heart. EP study is a procedure that is performed to diagnose arrhythmias by locating areas of heart tissue that interrupt the normal functioning of the heart's electrical system. During an EP study, the electrophysiologist inserts several long, flexible tubes with wires, called catheters, into the heart to record electrical activity within the heart chambers and to detect abnormal electrical pathways. The second part of the test involves electrical stimulation of various parts of the heart to induce an abnormal heart rhythm. This helps the electrophysiologist in treatment mapping, which could involve surgical removal of the abnormal tissue in the heart using a catheter.

North America is the largest consumption place, with a revenue market share nearly 36% in 2017. Following North America, Europe is the second largest consumption place with the revenue market share of 28%; China is also an important sales region for the Electrophysiology (EP) Device.

Over the next five years, LPI(LP Information) projects that Electrophysiology (EP) Device will register a 7.9% CAGR in terms of revenue, reach US\$ 6630 million by 2023, from US\$ 4200 million in 2017.
