Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Extracorporeal Shock Wave Therapy Device market for 2018-2023.

Extracorporeal Shock Wave Therapy (ESWT) is a noninvasive, FDA-approved technology that uses shock waves to treat chronic, painful conditions of the musculoskeletal system. The procedure has also proven to be extremely effective for improved penile function. ESWT produces intense, short energy waves that travel faster than the speed of sound. This shock wave, in turn, generates pulses of high pressure sound that travel through the skin, initiating tissue repair. ESWT can often heal even chronic conditions that the body has previously been unable to repair on its own. The weak shock waves interact with deep tissue where they cause mechanical stress and microtrauma that stimulate the body to jump into action.

The global ESWT devices market is dominated by few players from Switzerland, UK, Germany and United States, like Chattanooga(DJO), BTL from UK, Storz Medical and EMS Electro Medical Systems from Switzerland, while MTS Medical, Zimmer MedizinSysteme and Likamed GmbH from Germany. There are several middle and small size players from Korea, Turkey, Belgium and China, like Gymna from Belgium, HANIL-TM, HnT Medical and Urontech from Korea, Inceler Medikal from Turkey, while Wikkon, Longest, Xiangyu Medical and Shengchang Medical from China. The key technology is in the hand of the top players, some Chinese players import the key critical components and assembled in China, lack of key technologies, high costs, low price, low-quality and full of competition.

Over the next five years, LPI(LP Information) projects that Extracorporeal Shock Wave

Therapy Device will register a 5.8% CAGR in terms of revenue, reach US\$ 130 million by 2023, from US\$ 93 million in 2017.
