The term flame retardants subsumes a diverse group of chemicals which are added to manufactured materials, such as plastics and textiles, and surface finishes and coatings. Flame retardants are activated by the presence of an ignition source and are intended to prevent or slow the further development of ignition by a variety of different physical and chemical methods. They may be added as a copolymer during the polymerisation of a polymer, mixed with polymer at an moulding or extrusion process or, in particular for textiles, applied as a topical finish.[1] Mineral flame retardants are typically additive while organohalogen and organophosphorus compounds can be either reactive or additive.

Construction end use worth is projected to grow at an anticipated CAGR of 6.8% from 2017 to 2025.

Over the next five years, LPI(LP Information) projects that Flame Retardant will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
