In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Flight Inspection (FI) market for 2018-2023. Flight inspection has long been a vital part of providing a safe air transportation system. The concept is almost as old as the airways themselves. The first flight inspectors flew war surplus open-cockpit biplanes, bouncing around with airmail pilots and watching over a steadily growing airway system predicated on airway light beacons to provide navigational guidance. The advent of radio navigation brought an increased importance to the flight inspector, as his was the only platform that could evaluate the radio transmitters from where they were used: in the air. With the development of the Instrument Landing System (ILS) and the Very High Frequency Omni-directional Range (VOR), flight inspection became an essential element to verify the accuracy of the system. In the modern airspace system, GPS satellites now provide the basis for air navigation and signals further changes to aviation. Flight inspection has been there all along, quiet and meticulous, changing and developing through various government agencies charged with air safety: the Aeronautics Branch, Bureau of Air Commerce, the Civil Aeronautics Agency, through to the modern FAA. With continued growth of air transportation, and new technologies to support that growth, the essential means of flight inspection also changed, but its foundation, that of ensuring aviation safety, still remains the same.
