## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Floating House market for 2018-2023. Floating houses are built to be situated in a water body and are designed to adapt to rising and falling water levels. Floating houses are permanently in the water, while amphibious houses are situated above the water and are designed to float when the water levels rise. Amphibious homes are usually fastened to flexible mooring posts and rest on concrete foundations. If the water level rises, they can move upwards and float. The fastenings to the mooring posts limit the motion caused by the water. These type of houses are popular in highly populated areas where there is a high demand for houses near or in water. Because floating or amphibious houses adapt to rising water levels, they are very effective in dealing with floods. Living on water can also reduce the negative effects of heat, and may improve the quality of life of residents, who like to live on or near water. Floating houses have already been built in various countries, The house is designed to be entirely self-sustainable for up to a week at a time, offering its occupants the chance to take up residence on some of the world's most remote lakes and rivers.

Over the next five years, LPI(LP Information) projects that Floating House will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
