Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Gel Batteries market for 2018-2023.

A Gel battery design is typically a modification of the standard lead-acid automotive or marine battery. A gelling agent is added to the electrolyte to reduce movement inside the battery case. Many gel batteries also use one-way valves in place of open vents, which help the normal internal gasses to recombine back into water in the battery, reducing gassing. Generally, gel batteries are less tolerant of high heat and are charged at lower power than traditional or AGM batteries.

Regionally, China is the biggest consumption area of Gel batteries in the world and the North America follows.

For next few years, the global gel batteries revenue would keep increasing with annual growth rate with 6.09%. With the global consumption capacity gel batteries will reach 31728 M VAH in 2021. With the development of technology and rise of Consumption cost, the production of Gel batteries will rising, and the price of Gel batteries will decline. With the use of solar energy more and more widely, photovoltaic off-grid system in the use of reserve power requirements are increasingly high, the current use of photovoltaic systems in the use of gel batteries has become the mainstream.

Over the next five years, LPI(LP Information) projects that Gel Batteries will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
