In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Glass Recycling market for 2018-2023.

Glass recycling is the processing of waste glass into usable products. Glass waste should be separated by chemical composition, and then, depending on the end use and local processing capabilities, might also have to be separated into different colors. Many recyclers collect different colors of glass separately since glass retains its color after recycling. The most common types used for consumer containers are colorless glass, green glass, and brown or amber glass. Glass is ideal for recycling since none of the material is degraded by normal use.

When glass is used for new container manufacturing, it is virtually infinitely recyclable. The processing and use of recycled glass in manufacturing conserves raw materials, and reduces energy consumption. That which is not recycled, but crushed, reduces the volume of waste sent to landfills

Over the next five years, LPI(LP Information) projects that Glass Recycling will register a 5.1% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
