The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global High Temperature Superconductor market for 2018-2023.

High temperature superconductors are materials that behave as superconductors at unusually high temperatures. The high temperature superconductors represent a new class of materials that bear extraordinary superconducting, magnetic properties and great potential for various technological applications.

In consumption market, the global sales value increases with the 3.59% average growth rate. USA, Europe and Japan are the mainly consumption regions due to the bigger demand of downstream applications.

High temperature superconductor has two types, which include 1G HTS and 2G HTS. With the energy conservation advantage of high temperature superconductor, the downstream application industries will need more superconductor products. So, high temperature superconductor has a huge market potential in the future.

The major raw materials for superconductor are copper, silver, bismuth, yttrium, etc. Fluctuations in the price of the upstream product will impact on the production cost of superconductor, and then impact the price of superconductor.

We tend to believe this industry is a rising industry, and the consumption increasing degree will show a smooth growth curve. And the price presents downward tendency according to the technology development and international competition. Also, there will be fluctuation in gross margin.

Over the next five years, LPI(LP Information) projects that High Temperature Superconductor will register a 1.5% CAGR in terms of revenue, reach US\$ 520 million

by 2023, from US\$ 470 million in 2017.
